

# Technical presentation

Rodolfo Pietro Calabrò  
Pasquale Gatto

# Two kind of users

- Client

Send a transaction (event,vote) to miners

- Miner

Receive a transaction and validate it

Apply Proof of Lottery and send solution to other miners

Storing in Blockchain if all correct

# Communication protocol “Tri da chiazza”

This protocol take the name from a simple italian dialect word.

When in typical calabrian town the people see three friends in group, they often call it "i tri da chiazza".

This communication protocol a part every joke is very simple and useful for a didactic purpose.

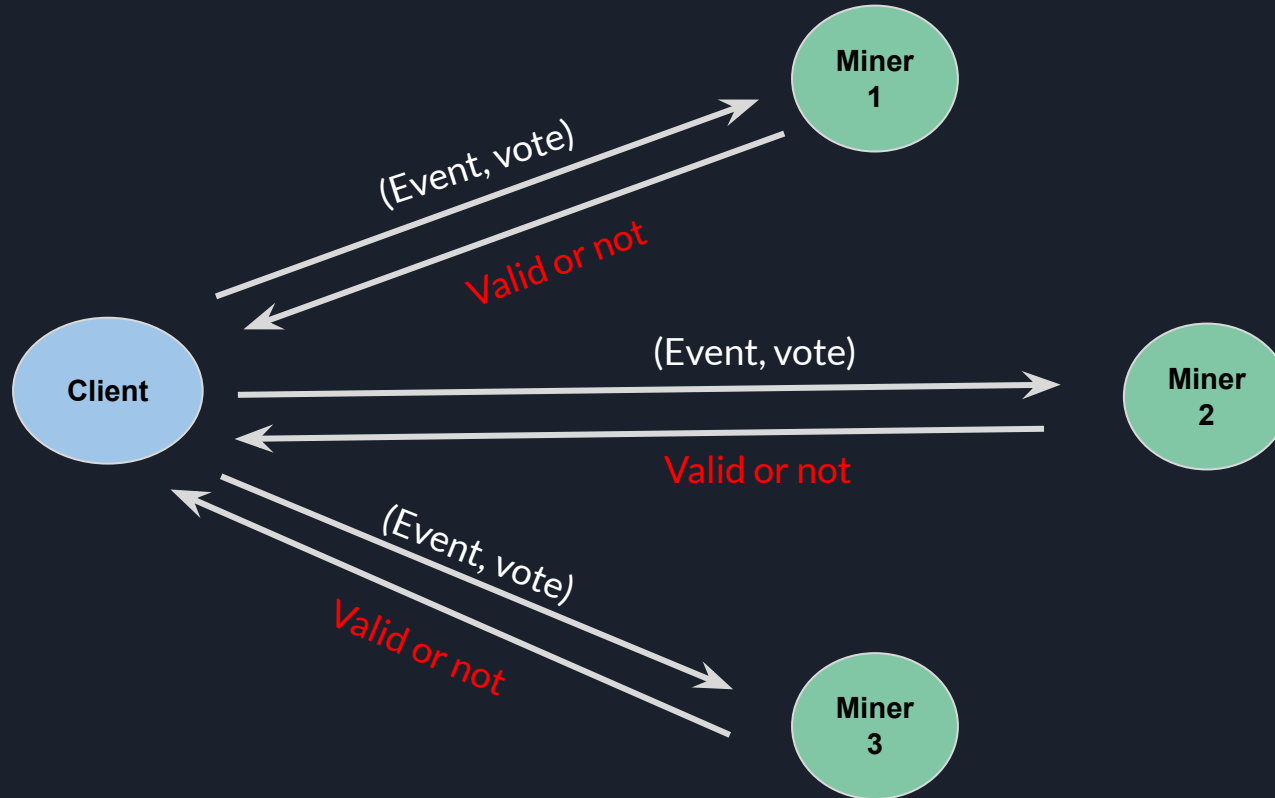

**To avoid problem** with p2p, such as nat, firewalls hole punching, and a lot of stuff...

We make a simple choice/requirement.

We need to know at least 3 know miners ip to send transactions.

In practical terms a blockchain to work must have at least 3 miners.

# Client - Send transaction

# Miner - Receive a transaction and validate it

(event,vote) validation:

## Semantic

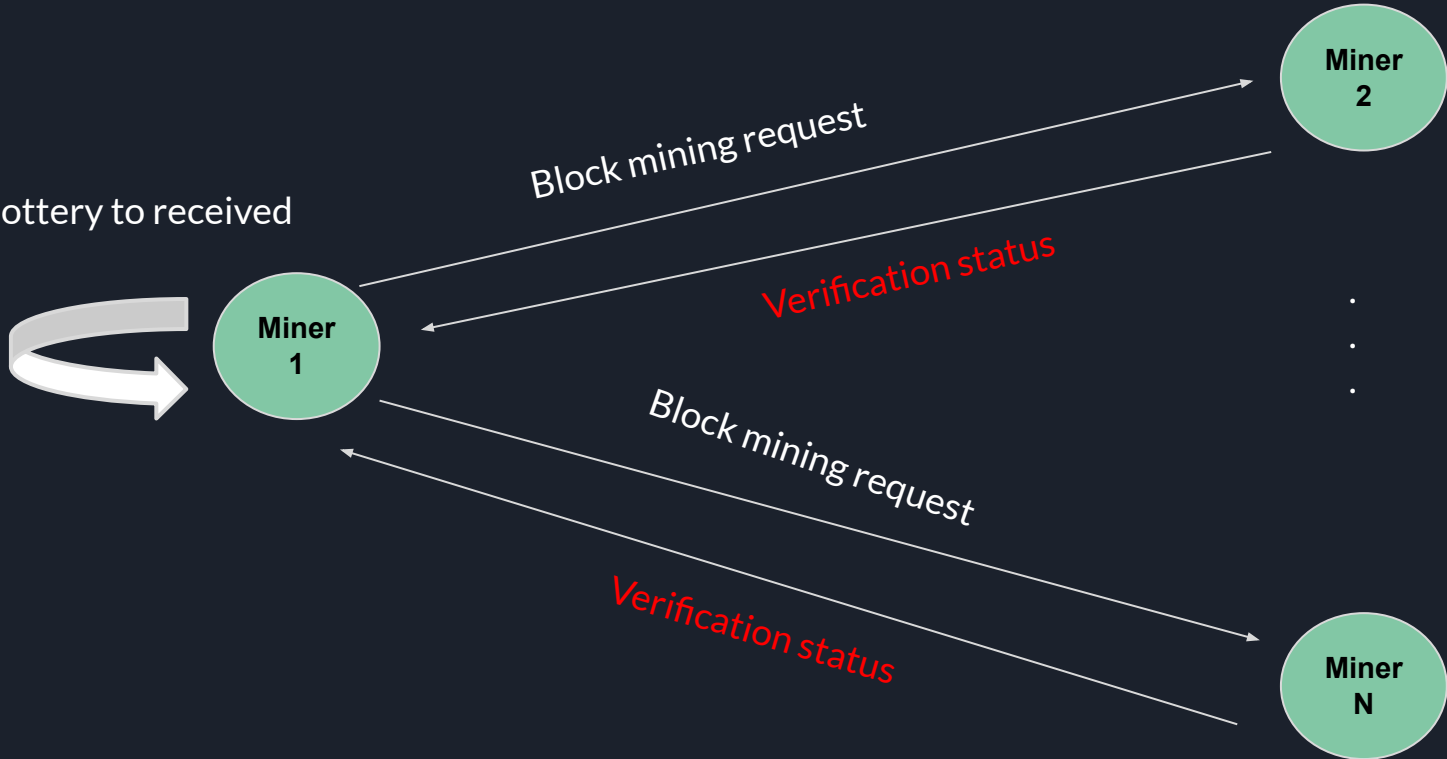

- (event, vote) isn't already sent
  - (event, vote) isn't in the ledger
- (Obviously by the same address of sender)

## Syntax

- **vote** is numeric
- **event** is not empty and doesn't contain |,; and other special characters

# Miner - Apply Proof of Lottery and send solution to other miners

Apply proof of lottery to received transactions

# Proof of Lottery in nutshell

SHA256(miner\_address)

LOTTERY NUMBER (L1)

LOTTERY FUNCTION

WINNING CONDITION

random **seed** such that  
 $L1 = L2$

SHA256(block\_hash)

block\_hash = str(transactions\_list + seed)

LOTTERY NUMBER (L2)

LOTTERY FUNCTION

# Lottery Function Definition

weight(b) =  $w_1$

...

weight(a) =  $w_i$

ba7816bf8f01cfe**a**...

LOTTERY FUNCTION

$$L = \text{SUM}(w_i \mid i = 1 \dots 256)$$

# Proof of Lottery

A notebook is better than 10000 slides:

# Storing in Blockchain if all correct

Miner

Ledger

BLOCK

TIMESTAMP

SEED

TRANSACTIONS

BLOCK\_HASH

PREVIOUS\_BLOCK\_HASH

LOTTERY\_NUMBER

...

## NOTE:

Each miner attend all notifications of other miners (Miners are fully connected).

If more miners mine the same transactions, the winner is the miner that find the solution with the smallest seed
